

Table 28. DISCREPANCIES

1.	<p>Indications for emergency and urgent surgical decompression to counteract irreversible neurologic deficit in patients with confirmed hematopoietic tumors should be established individually after discussion with a patient and with the opinion kept in mind that hematopoietic tumors should undergo systemic treatment</p>		<p>No evidence were yielded from the literature regarding survival and curability after surgical decompression of hematopoietic tumors with adjuvant therapy vs primarily systemic therapy</p>		
2.	<p>Proceeding with decompression of the spinal canal in patients with tumor of unknown origin and threatening severe neurological deficit without biopsy should be individually discussed with a patient. A patient may have a reduced chance of cure if the tumor turns out to be the primary tumor after histological examination</p>		<p>See treatment recommendation for primary tumours in table 2</p>
